Question 1

$$\int_3^e \left(\frac{x^3 - x}{x^2}\right) dx$$

Proof:

$$\int_3^e \left(\frac{x^3}{x^2} - \frac{x}{x^2}\right) dx$$

Cancel the terms out:

$$\int_3^e \left(x - \frac{1}{x}\right)$$

Integrate:

$$= \left[\frac{x^2}{2} - \ln|x|\right]_3^e$$

Plug in for the definite integral: F(b) - F(a):

$$\left(\frac{e^2}{2} - lne\right) - \left(\frac{9}{2} - ln3\right)$$

Remember that $\ln e = 1$

$$= \left(\frac{e^2}{2} - 1\right) - \frac{9}{2} + \ln 3$$

$$= \frac{e^2}{2} - \frac{2}{2} - \frac{9}{2} + \ln 3$$

$$= \frac{e^2}{2} - \frac{11}{2} + \ln 3$$

😄

Question 2

$$\int \tan^2 2x dx \tag{1}$$

Proof:

Remember that the $\int \tan^2 2x = 1 - \sec^2 2x$

Rewrite:

$$\int \left(1 - \sec^2 2x\right) dx$$

Let u = 2x

du = 2dx

$$\frac{du}{2} = dx$$

$$\int \left(1 - \sec^2(2x)\right) \frac{du}{2}$$

Separate into two integrals:

$$\int \left[1\right] - \int \left[- \sec^2(2x)\right] \frac{du}{2} \tag{2}$$

(3)

Remember that $\int \sec^2 u du = \tan u + C$

Evaluate: (4)

$$x + \left[- \tan 2x + C\right] \frac{du}{2} \tag{5}$$

Note that the constant 1/2 is only applied to the tan (6)

$$x - \frac{1}{2} \tan 2x + C \tag{7}$$

😄

REVIEW OF BASIC INTEGRATION RULES ($a > 0$)

1. $\int kf(u)du = k\int f(u)du$
2. $\int [f(u) \pm g(u)]du = \int f(u)du \pm \int g(u)du$
3. $\int du = u + C$
4. $\int u^n du = \frac{u^{n+1}}{n+1} + C, n \neq -1$
5. $\int \frac{du}{u} = \ln|u| + C$
6. $\int e^u du = e^u + C$
7. $\int a'' du = \left(\frac{1}{\ln a}\right) a^u + C$
8. $\int \sin u du = -\cos u + C$
9. $\int \cos u du = \sin u + C$
10. $\int \tan u du = -\ln|\cos u| + C$

PROCEDURES FOR FITTING INTEGRANDS TO BASIC INTEGRATION RULE

Expand (numerator).

$$(1 + e^x)^2 = 1 + 2e^x + e^{2x} \tag{8}$$

(9)

Separate numerator.

$$\frac{1+x}{x^2+1} = \frac{1}{x^2+1} + \frac{x}{x^2+1} \tag{10}$$

(11)

Complete the square.

$$\frac{1}{\sqrt{2x - x^2}} = \frac{1}{\sqrt{1 - (x-1)^2}} \tag{12}$$

(13)

Divide improper rational function.

$$\frac{x^2}{x^2+1} = 1 - \frac{1}{x^2+1} \tag{14}$$

(15)

Add and subtract terms in numerator.

$$\frac{2x}{x^2+2x+1} = \frac{2x+2-2}{x^2+2x+1} = \frac{2x+2}{x^2+2x+1} - \frac{2}{(x+1)^2} \tag{16}$$

(17)

Use trigonometric identities.

$$\cot^2 x = \csc^2 x - 1 \tag{18}$$

(19)

Multiply and divide by Pythagorean conjugate.

$$\frac{1}{1+\sin x} = \left(\frac{1}{1+\sin x}\right)\left(\frac{1-\sin x}{1-\sin x}\right) = \frac{1-\sin x}{1-\sin^2 x} \tag{20}$$

$$= \frac{1-\sin x}{\cos^2 x} = \sec^2 x - \frac{\sin x}{\cos^2 x} \tag{21}$$

(22)

Question 3

Evaluate: (23)

$$\int_0^1 \frac{x+3}{\sqrt[2]{4-x^2}} dx \tag{24}$$

Proof:

Separate into two terms for integration: (25)

$$\int_0^1 \left(\frac{x}{\sqrt{4-x^2}} + \frac{3}{\sqrt{4-x^2}}\right) dx \tag{26}$$

😄
